

# **-ME REFERENCE MANUAL**

*Release 1.1/25*

*Eric P. Allman*

Electronics Research Laboratory  
University of California, Berkeley  
Berkeley, California 94720

This document describes in extremely terse form the features of the **-me** macro package for version seven NROFF/TROFF. Some familiarity is assumed with those programs, specifically, the reader should understand breaks, fonts, pointsizes, the use and definition of number registers and strings, how to define macros, and scaling factors for ens, points, **v**'s (vertical line spaces), etc.

For a more casual introduction to text processing using NROFF, refer to the document *Writing Papers with NROFF using -me*.

There are a number of macro parameters that may be adjusted. Fonts may be set to a font number only. In NROFF font 8 is underlined, and is set in bold font in TROFF (although font 3, bold in TROFF, is not underlined in NROFF). Font 0 is no font change; the font of the surrounding text is used instead. Notice that fonts 0 and 8 are "pseudo-fonts"; that is, they are simulated by the macros. This means that although it is legal to set a font register to zero or eight, it is not legal to use the escape character form, such as:

```
\f8
```

All distances are in basic units, so it is nearly always necessary to use a scaling factor. For example, the request to set the paragraph indent to eight one-en spaces is:

```
.nr pi 8n
```

and not

```
.nr pi 8
```

which would set the paragraph indent to eight basic units, or about 0.02 inch. Default parameter values are given in brackets in the remainder of this document.

Registers and strings of the form **\$x** may be used in expressions but should not be changed. Macros of the form **\$x** perform some function (as described) and may be redefined to change this function. This may be a sensitive operation; look at the body of the original macro before changing it.

All names in **-me** follow a rigid naming convention. The user may define number registers, strings, and macros, provided that s/he uses single character upper case names or double character names consisting of letters and digits, with at least one upper case letter. In no case should special characters be used in user-defined names.

---

†NROFF and TROFF are Trademarks of Bell Laboratories.

On daisy wheel type printers in twelve pitch, the `-rx1` flag can be stated to make lines default to one eighth inch (the normal spacing for a newline in twelve-pitch). This is normally too small for easy readability, so the default is to space one sixth inch.

This documentation was TROFF'ed on August 11, 2004 and applies to version 1.1/25 of the `-me` macros.

## 1. Paragraphing

These macros are used to begin paragraphs. The standard paragraph macro is `.pp`; the others are all variants to be used for special purposes.

The first call to one of the paragraphing macros defined in this section or the `.sh` macro (defined in the next session) *initializes* the macro processor. After initialization it is not possible to use any of the following requests: `.sc`, `.lo`, `.th`, or `.ac`. Also, the effects of changing parameters which will have a global effect on the format of the page (notably page length and header and footer margins) are not well defined and should be avoided.

`.lp` `\h'|108000u'` Begin left-justified paragraph. Centering and underlining are turned off if they were on, the font is set to `\n(pf [1])` the type size is set to `\n(pp [10p])`, and a `\n(ps` space is inserted before the paragraph [0.35v in TROFF, 1v or 0.5v in NROFF depending on device resolution]. The indent is reset to `\n($i [0])` plus `\n(po [0])` unless the paragraph is inside a display. (see `.ba`). At least the first two lines of the paragraph are kept together on a page.

`.pp` `\h'|108000u'` Like `.lp`, except that it puts `\n(pi [5n])` units of indent. This is the standard paragraph macro.

`.ip` `T I \h'|108000u'` Indented paragraph with hanging tag. The body of the following paragraph is indented *I* spaces (or `\n(ii [5n])` spaces if *I* is not specified) more than a non-indented paragraph (such as with `.pp`) is. The title *T* is exdented (opposite of indented). The result is a paragraph with an even left edge and *T* printed in the margin. Any spaces in *T* must be unpaddingable. If *T* will not fit in the space provided, `.ip` will start a new line.

`.np` `\h'|108000u'` A variant of `.ip` which numbers paragraphs. Numbering is reset after a `.lp`, `.pp`, or `.sh`. The current paragraph number is in `\n($p)`.

## 2. Section Headings

Numbered sections are similar to paragraphs except that a section number is automatically generated for each one. The section numbers are of the form **1.2.3**. The *depth* of the section is the count of numbers (separated by decimal points) in the section number.

Unnumbered section headings are similar, except that no number is attached to the heading.

`.sh` `+N T a b c d e f \h'|108000u'` Begin numbered section of depth *N*. If *N* is missing the current depth (maintained in the number register `\n($0)` is used. The values of the individual parts of the section number are maintained in `\n($1` through `\n($6)`. There is a `\n(ss [1v])` space before the section. *T* is printed as a section title in font `\n(sf [8])` and size `\n(sp [10p])`. The “name” of the section may be accessed via `\n($n)`. If `\n($i)` is non-zero, the base indent is set to `\n($i)` times the section depth, and the section title is exdented. (See `.ba`.) Also, an additional indent of `\n($o [0])` is added to the section title (but not to the body of the section). The font is then set to the paragraph font, so that more information may occur on the line with the section number and title. `.sh` insures that there is enough room to print the section head plus the beginning of a paragraph (about 3 lines total). If *a* through *f* are specified, the section number is set to that number rather than incremented automatically. If any of *a* through *f* are a hyphen that number is not reset. If *T* is

a single underscore (“\_”) then the section depth and numbering is reset, but the base indent is not reset and nothing is printed out. This is useful to automatically coordinate section numbers with chapter numbers.

- .sx** *+N* \h'|108000u'\c Go to section depth *N* [-1], but do not print the number and title, and do not increment the section number at level *N*. This has the effect of starting a new paragraph at level *N*.
- .uh** *T* \h'|108000u'\c Unnumbered section heading. The title *T* is printed with the same rules for spacing, font, etc., as for **.sh**.
- .\$p** *T B N* \h'|108000u'\c Print section heading. May be redefined to get fancier headings. *T* is the title passed on the **.sh** or **.uh** line; *B* is the section number for this section, and *N* is the depth of this section. These parameters are not always present; in particular, **.sh** passes all three, **.uh** passes only the first, and **.sx** passes three, but the first two are null strings. Care should be taken if this macro is redefined; it is quite complex and subtle.
- .\$0** *T B N* \h'|108000u'\c This macro is called automatically after every call to **.\$p**. It is normally undefined, but may be used to automatically put every section title into the table of contents or for some similar function. *T* is the section title for the section title which was just printed, *B* is the section number, and *N* is the section depth.
- .\$1** – **.\$6** \h'|108000u'\c Traps called just before printing that depth section. May be defined to (for example) give variable spacing before sections. These macros are called from **.\$p**, so if you redefine that macro you may lose this feature.

### 3. Headers and Footers

Headers and footers are put at the top and bottom of every page automatically. They are set in font **\n(tf** [3] and size **\n(tp** [10p]. Each of the definitions apply as of the *next* page. Three-part titles must be quoted if there are two blanks adjacent anywhere in the title or more than eight blanks total.

The spacing of headers and footers are controlled by three number registers. **\n(hm** [4v] is the distance from the top of the page to the top of the header, **\n(fm** [3v] is the distance from the bottom of the page to the bottom of the footer, **\n(tm** [7v] is the distance from the top of the page to the top of the text, and **\n(bm** [6v] is the distance from the bottom of the page to the bottom of the text (nominal). The macros **.m1**, **.m2**, **.m3**, and **.m4** are also supplied for compatibility with ROFF documents.

- .he** *l m r* \h'|108000u'\c Define three-part header, to be printed on the top of every page.
- .fo** *l m r* \h'|108000u'\c Define footer, to be printed at the bottom of every page.
- .eh** *l m r* \h'|108000u'\c Define header, to be printed at the top of every even-numbered page.
- .oh** *l m r* \h'|108000u'\c Define header, to be printed at the top of every odd-numbered page.
- .ef** *l m r* \h'|108000u'\c Define footer, to be printed at the bottom of every even-numbered page.
- .of** *l m r* \h'|108000u'\c Define footer, to be printed at the bottom of every odd-numbered page.
- .hx** \h'|108000u'\c Suppress headers and footers on the next page.
- .m1** *+N* \h'|108000u'\c Set the space between the top of the page and the header [4v].
- .m2** *+N* \h'|108000u'\c Set the space between the header and the first line of text [2v].
- .m3** *+N* \h'|108000u'\c Set the space between the bottom of the text and the footer [2v].
- .m4** *+N* \h'|108000u'\c Set the space between the footer and the bottom of the page [4v].
- .ep** \h'|108000u'\c End this page, but do not begin the next page. Useful for forcing out footnotes, but other than that hardly ever used. Must be followed by a **.bp** or the end of input.
- .\$h** \h'|108000u'\c Called at every page to print the header. May be redefined to provide fancy (e.g., multi-line) headers, but doing so loses the function of the **.he**, **.fo**, **.eh**, **.oh**, **.ef**, and **.of**

requests, as well as the chapter-style title feature of `.+c`.

`.$f \h'|108000u'\c` Print footer; same comments apply as in `.$h`.

`.$H \h'|108000u'\c` A normally undefined macro which is called at the top of each page (after outputting the header, initial saved floating keeps, etc.); in other words, this macro is called immediately before printing text on a page. It can be used for column headings and the like.

#### 4. Displays

All displays except centered blocks and block quotes are preceded and followed by an extra `\n(bs` [same as `\n(ps`] space. Quote spacing is stored in a separate register; centered blocks have no default initial or trailing space. The vertical spacing of all displays except quotes and centered blocks is stored in register `\n($R` instead of `\n($r`.

`.(l m f \h'|108000u'\c` Begin list. Lists are single spaced, unfilled text. If  $f$  is **F**, the list will be filled. If  $m$  [**I**] is **I** the list is indented by `\n(bi` [4n]; if **M** the list is indented to the left margin; if **L** the list is left justified with respect to the text (different from **M** only if the base indent (stored in `\n($i` and set with `.ba`) is not zero); and if **C** the list is centered on a line-by-line basis. The list is set in font `\n(df` [0]. Must be matched by a `.)l`. This macro is almost like `.(b` except that no attempt is made to keep the display on one page.

`.)l \h'|108000u'\c` End list.

`.(q \h'|108000u'\c` Begin major quote. These are single spaced, filled, moved in from the text on both sides by `\n(qi` [4n], preceded and followed by `\n(qs` [same as `\n(bs`] space, and are set in point size `\n(qp` [one point smaller than surrounding text].

`.)q \h'|108000u'\c` End major quote.

`.(b m f \h'|108000u'\c` Begin block. Blocks are a form of *keep*, where the text of a keep is kept together on one page if possible (keeps are useful for tables and figures which should not be broken over a page). If the block will not fit on the current page a new page is begun, *unless* that would leave more than `\n(bt` [0] white space at the bottom of the text. If `\n(bt` is zero, the threshold feature is turned off. Blocks are not filled unless  $f$  is **F**, when they are filled. The block will be left-justified if  $m$  is **L**, indented by `\n(bi` [4n] if  $m$  is **I** or absent, centered (line-for-line) if  $m$  is **C**, and left justified to the margin (not to the base indent) if  $m$  is **M**. The block is set in font `\n(df` [0].

`.)b \h'|108000u'\c` End block.

`.(z m f \h'|108000u'\c` Begin floating keep. Like `.(b` except that the keep is *float*ed to the bottom of the page or the top of the next page. Therefore, its position relative to the text changes. The floating keep is preceded and followed by `\n(zs` [1v] space. Also, it defaults to mode **M**.

`.)z \h'|108000u'\c` End floating keep.

`.(c \h'|108000u'\c` Begin centered block. The next keep is centered as a block, rather than on a line-by-line basis as with `.(b C`. This call may be nested inside keeps.

`.)c \h'|108000u'\c` End centered block.

#### 5. Annotations

`.(d \h'|108000u'\c` Begin delayed text. Everything in the next keep is saved for output later with `.pd`, in a manner similar to footnotes.

`.)d n \h'|108000u'\c` End delayed text. The delayed text number register `\n($d` and the associated string `\*#` are incremented if `\*#` has been referenced.

- .pd**  $\backslash h' | 108000 u' \backslash c$  Print delayed text. Everything diverted via **.(d** is printed and truncated. This might be used at the end of each chapter.
- .(f**  $\backslash h' | 108000 u' \backslash c$  Begin footnote. The text of the footnote is floated to the bottom of the page and set in font  $\backslash n(\mathbf{ff}$  [1] and size  $\backslash n(\mathbf{fp}$  [8p]. Each entry is preceded by  $\backslash n(\mathbf{fs}$  [0.2v] space, is indented  $\backslash n(\mathbf{fi}$  [3n] on the first line, and is indented  $\backslash n(\mathbf{fu}$  [0] from the right margin. Footnotes line up underneath two columned output. If the text of the footnote will not all fit on one page it will be carried over to the next page.
- .)f n**  $\backslash h' | 108000 u' \backslash c$  End footnote. The number register  $\backslash n(\mathbf{\$f}$  and the associated string  $\backslash **$  are incremented if they have been referenced.
- .\$s**  $\backslash h' | 108000 u' \backslash c$  The macro to output the footnote separator. This macro may be redefined to give other size lines or other types of separators. Currently it draws a 1.5i line.
- .(x x**  $\backslash h' | 108000 u' \backslash c$  Begin index entry. Index entries are saved in the index  $x$  [**x**] until called up with **.xp**. Each entry is preceded by a  $\backslash n(\mathbf{xs}$  [0.2v] space. Each entry is “undented” by  $\backslash n(\mathbf{xu}$  [0.5i]; this register tells how far the page number extends into the right margin.
- .)x P A**  $\backslash h' | 108000 u' \backslash c$  End index entry. The index entry is finished with a row of dots with  $A$  [null] right justified on the last line (such as for an author’s name), followed by  $P$  [ $\backslash n\%$ ]. If  $A$  is specified,  $P$  must be specified;  $\backslash n\%$  can be used to print the current page number. If  $P$  is an underscore, no page number and no row of dots are printed.
- .xp x**  $\backslash h' | 108000 u' \backslash c$  Print index  $x$  [**x**]. The index is formatted in the font, size, and so forth in effect at the time it is printed, rather than at the time it is collected.

## 6. Columned Output

- .2c +S N**  $\backslash h' | 108000 u' \backslash c$  Enter two-column mode. The column separation is set to  $+S$  [4n, 0.5i in ACM mode] (saved in  $\backslash n(\mathbf{\$s}$ ). The column width, calculated to fill the single column line length with both columns, is stored in  $\backslash n(\mathbf{\$l}$ . The current column is in  $\backslash n(\mathbf{\$c}$ . You can test register  $\backslash n(\mathbf{\$m}$  [1] to see if you are in single column or double column mode. Actually, the request enters  $N$  [2] columned output.
- .1c**  $\backslash h' | 108000 u' \backslash c$  Revert to single-column mode.
- .bc**  $\backslash h' | 108000 u' \backslash c$  Begin column. This is like **.bp** except that it begins a new column on a new page only if necessary, rather than forcing a whole new page if there is another column left on the current page.

## 7. Fonts and Sizes

- .sz +P**  $\backslash h' | 108000 u' \backslash c$  The pointsize is set to  $P$  [10p], and the line spacing is set proportionally. The ratio of line spacing to pointsize is stored in  $\backslash n(\mathbf{\$r}$ . The ratio used internally by displays and annotations is stored in  $\backslash n(\mathbf{\$R}$  (although this is not used by **.sz**).
- .r W X**  $\backslash h' | 108000 u' \backslash c$  Set  $W$  in roman font, appending  $X$  in the previous font. To append different font requests, use  $X = \backslash c$ . If no parameters, change to roman font.
- .i W X**  $\backslash h' | 108000 u' \backslash c$  Set  $W$  in italics, appending  $X$  in the previous font. If no parameters, change to italic font. Underlines in NROFF.
- .b W X**  $\backslash h' | 108000 u' \backslash c$  Set  $W$  in bold font and append  $X$  in the previous font. If no parameters, switch to bold font. In NROFF, underlines.
- .rb W X**  $\backslash h' | 108000 u' \backslash c$  Set  $W$  in bold font and append  $X$  in the previous font. If no parameters, switch to bold font. **.rb** differs from **.b** in that **.rb** does not underline in NROFF.
- .u W X**  $\backslash h' | 108000 u' \backslash c$  Underline  $W$  and append  $X$ . This is a true underlining, as opposed to the **.ul** request, which changes to “underline font” (usually italics in TROFF). It won’t work right if  $W$  is spread or broken (including hyphenated). In other words, it is safe

in nofi ll mode only.

- .q**  $W X \backslash h' | 108000 u' \backslash c$  Quote  $W$  and append  $X$ . In NROFF this just surrounds  $W$  with double quote marks ('"'), but in TROFF uses directed quotes.
- .bi**  $W X \backslash h' | 108000 u' \backslash c$  Set  $W$  in bold italics and append  $X$ . Actually, sets  $W$  in italic and overstrikes once. Underlines in NROFF. It won't work right if  $W$  is spread or broken (including hyphenated). In other words, it is safe in nofi ll mode only.
- .bx**  $W X \backslash h' | 108000 u' \backslash c$  Sets  $W$  in a box, with  $X$  appended. Underlines in NROFF. It won't work right if  $W$  is spread or broken (including hyphenated). In other words, it is safe in nofi ll mode only.

## 8. Roff Support

- .ix**  $+N \backslash h' | 108000 u' \backslash c$  Indent, no break. Equivalent to `'in N`.
- .bl**  $N \backslash h' | 108000 u' \backslash c$  Leave  $N$  contiguous white space, on the next page if not enough room on this page. Equivalent to a `.sp N` inside a block.
- .pa**  $+N \backslash h' | 108000 u' \backslash c$  Equivalent to `.bp`.
- .ro**  $\backslash h' | 108000 u' \backslash c$  Set page number in roman numerals. Equivalent to `.af % i`.
- .ar**  $\backslash h' | 108000 u' \backslash c$  Set page number in arabic. Equivalent to `.af % 1`.
- .n1**  $\backslash h' | 108000 u' \backslash c$  Number lines in margin from one on each page.
- .n2**  $N \backslash h' | 108000 u' \backslash c$  Number lines from  $N$ , stop if  $N = 0$ .
- .sk**  $\backslash h' | 108000 u' \backslash c$  Leave the next output page blank, except for headers and footers. This is used to leave space for a full-page diagram which is produced externally and pasted in later. To get a partial-page paste-in display, say `.sv N`, where  $N$  is the amount of space to leave; this space will be output immediately if there is room, and will otherwise be output at the top of the next page. However, be warned: if  $N$  is greater than the amount of available space on an empty page, no space will ever be output.

## 9. Preprocessor Support

- .EQ**  $m T \backslash h' | 108000 u' \backslash c$  Begin equation. The equation is centered if  $m$  is **C** or omitted, indented `\n(bi [4n]` if  $m$  is **I**, and left justified if  $m$  is **L**.  $T$  is a title printed on the right margin next to the equation. See *Typesetting Mathematics – User's Guide* by Brian W. Kernighan and Lorinda L. Cherry.
- .EN**  $c \backslash h' | 108000 u' \backslash c$  End equation. If  $c$  is **C** the equation must be continued by immediately following with another `.EQ`, the text of which can be centered along with this one. Otherwise, the equation is printed, always on one page, with `\n(es [0.5v in TROFF, 1v in NROFF]` space above and below it.
- .TS**  $h \backslash h' | 108000 u' \backslash c$  Table start. Tables are single spaced and kept on one page if possible. If you have a large table which will not fit on one page, use  $h = \mathbf{H}$  and follow the header part (to be printed on every page of the table) with a `.TH`. See *Tbl – A Program to Format Tables* by M. E. Lesk.
- .TH**  $\backslash h' | 108000 u' \backslash c$  With `.TS H`, ends the header portion of the table.
- .TE**  $\backslash h' | 108000 u' \backslash c$  Table end. Note that this table does not fbat, in fact, it is not even guaranteed to stay on one page if you use requests such as `.sp` intermixed with the text of the table. If you want it to fbat (or if you use requests inside the table), surround the entire table (including the `.TS` and `.TE` requests) with the requests `.(z` and `.)z`.

## 10. Miscellaneous

- .re** \h'|108000u'\c Reset tabs. Set to every 0.5i in TROFF and every 0.8i in NROFF.
- .ba** +N \h'|108000u'\c Set the base indent to +N [0] (saved in \n(\$i). All paragraphs, sections, and displays come out indented by this amount. Titles and footnotes are unaffected. The **.sh** request performs a **.ba** request if \n(\$i [0] is not zero, and sets the base indent to \n(\$i\*\n(\$0).
- .xl** +N \h'|108000u'\c Set the line length to N [6.0i]. This differs from **.ll** because it only affects the current environment.
- .ll** +N \h'|108000u'\c Set line length in all environments to N [6.0i]. This should not be used after output has begun, and particularly not in two-columned output. The current line length is stored in \n(\$l).
- .hl** \h'|108000u'\c Draws a horizontal line the length of the page. This is useful inside fbating keeps to differentiate between the text and the figure.
- .lo** \h'|108000u'\c This macro loads another set of macros (in /usr/lib/me/local.me) which is intended to be a set of locally defined macros. These macros should all be of the form **.\*X**, where X is any letter (upper or lower case) or digit.

## 11. Standard Papers

- .tp** \h'|108000u'\c Begin title page. Spacing at the top of the page can occur, and headers and footers are suppressed. Also, the page number is not incremented for this page.
- .th** \h'|108000u'\c Set thesis mode. This defines the modes acceptable for a doctoral dissertation at Berkeley. It double spaces, defines the header to be a single page number, and changes the margins to be 1.5 inch on the left and one inch on the top. **.++** and **.+c** should be used with it. This macro must be stated before initialization, that is, before the first call of a paragraphing macro or **.sh**.
- .++ m H** \h'|108000u'\c This request defines the section of the paper which we are entering. The section type is defined by *m*. **C** means that we are entering the chapter portion of the paper, **A** means that we are entering the appendix portion of the paper, **P** means that the material following should be the preliminary portion (abstract, table of contents, etc.) portion of the paper, **AB** means that we are entering the abstract (numbered independently from 1 in Arabic numerals), and **B** means that we are entering the bibliographic portion at the end of the paper. Also, the variants **RC** and **RA** are allowed, which specify renumbering of pages from one at the beginning of each chapter or appendix, respectively. The *H* parameter defines the new header. If there are any spaces in it, the entire header must be quoted. If you want the header to have the chapter number in it, Use the string \\\n(ch. For example, to number appendixes **A.1** etc., type **.++ RA ``\\n(ch.%'**. Each section (chapter, appendix, etc.) should be preceded by the **.+c** request. It should be mentioned that it is easier when using TROFF to put the front material at the end of the paper, so that the table of contents can be collected and output; this material can then be physically moved to the beginning of the paper.
- .+c T** \h'|108000u'\c Begin chapter with title *T*. The chapter number is maintained in \n(ch. This register is incremented every time **.+c** is called with a parameter. The title and chapter number are printed by **.\$c**. The header is moved to the footer on the first page of each chapter. If *T* is omitted, **.\$c** is not called; this is useful for doing your own "title page" at the beginning of papers without a title page proper. **.\$c** calls **.\$C** as a hook so that chapter titles can be inserted into a table of contents automatically. The footnote numbering is reset to one.

- .Sc**  $T$  Print chapter number (from  $\backslash n(\mathbf{ch})$  and  $T$ . This macro can be redefined to your liking. It is defined by default to be acceptable for a PhD thesis at Berkeley. This macro calls  $\$C$ , which can be defined to make index entries, or whatever.
- .SC**  $KNT$  This macro is called by **.Sc**. It is normally undefined, but can be used to automatically insert index entries, or whatever.  $K$  is a keyword, either “Chapter” or “Appendix” (depending on the  $++$  mode);  $N$  is the chapter or appendix number, and  $T$  is the chapter or appendix title.
- .ac**  $AN$  This macro (short for **.acm**) sets up the NROFF environment for photo-ready papers as used by the ACM. This format is 25% larger, and has no headers or footers. The author’s name  $A$  is printed at the bottom of the page (but off the part which will be printed in the conference proceedings), together with the current page number and the total number of pages  $N$ . Additionally, this macro loads the file `/usr/lib/me/acm.me`, which may later be augmented with other macros useful for printing papers for ACM conferences. It should be noted that this macro will not work correctly in TROFF, since it sets the page length wider than the physical width of the phototypesetter roll.

## 12. Predefined Strings

- \*\*** Footnote number, actually  $\backslash n(\mathbf{f})$ . This macro is incremented after each call to **.f**.
- #** Delayed text number. Actually  $\backslash n(\mathbf{d})$ .
- [** Superscript. This string gives upward movement and a change to a smaller point size if possible, otherwise it gives the left bracket character ( $[$ ). Extra space is left above the line to allow room for the superscript.
- ]** Unsuperscript. Inverse to **[**. For example, to produce a superscript you might type  $\mathbf{x}[\mathbf{2}]$ , which will produce  $\mathbf{x.TL}$
- <** Subscript. Defaults to ‘<’ if half-carriage motion not possible. Extra space is left below the line to allow for the subscript.
- >** Inverse to **<**.
- (dw)** The day of the week, as a word.
- (mo)** The month, as a word.
- (td)** Today’s date, directly printable. The date is of the form August 11, 2004. Other forms of the date can be used by using  $\backslash n(\mathbf{dy})$  (the day of the month; for example, 11),  $\backslash n(\mathbf{mo})$  (as noted above) or  $\backslash n(\mathbf{mo})$  (the same, but as an ordinal number; for example, August is 8), and  $\backslash n(\mathbf{yr})$  (the last two digits of the current year).
- (lq)** Left quote marks. Double quote in NROFF.
- (rq)** Right quote.
- $\frac{3}{4}$  em dash in TROFF; two hyphens in NROFF.

## 13. Special Characters and Marks

There are a number of special characters and diacritical marks (such as accents) available through `-me`. To reference these characters, you must call the macro **.sc** to define the characters before using them.

**.sc** Define special characters and diacritical marks, as described in the remainder of this section. This macro must be stated before initialization.

The special characters available are listed below.

Name	Usage	Example	
Acute accent	$\backslash *$	$a\backslash *$	á
Grave accent	$\backslash ^$	$e\backslash ^$	è

Umlat	*:	u *:	ü
Tilde	*~	n *~	ñ
Caret	*^	e *^	ê
Cedilla	*,	c *,	ç
Czech	*v	e *v	ě
Circle	*o	A *o	Å
There exists	*(qe		∃
For all	*(qa		∀

## Acknowledgments

I would like to thank Bob Epstein, Bill Joy, and Larry Rowe for having the courage to use the -me macros to produce non-trivial papers during the development stages; Ricki Blau, Pamela Humphrey, and Jim Joyce for their help with the documentation phase; and the plethora of people who have contributed ideas and have given support for the project.
